About

This demo uses **SWIRL** to build a façade for a slots machine. The machine has no more internal logic to it than spinning a fixed symbol distance, but it's enough for displaying the possibilities of the library.

Building and Testing

(See `../../README.pdf` for the building process and requisites.)

Once the project is built, deploy the contents of the `./out` folder where it can be displayed by a web server, and point your browser at it. It's not possible to use a `file://` location as certain browsers prevent local file reading and asset loading wouldn't work.
